MEDIA RELEASE

FC 3115 D – FC 3115 R Rear mounted mower conditioners

KUHN completes its offer in mower conditioners for forage producing farms and contractors with finger or roller conditioner by adding two rear mounted models with vertical folding and a 3.10 m working width.

The mowing unit folds to 126° to achieve maximum compactness for transport and optimal weight balance on the tractor's rear wheels.

The FC 3115 D features the gearbox-powered DIGIDRY steel pivoting finger rotor, perfectly suited for difficult conditions. With a diameter of 540 mm, it offers an exceptional conditioning capacity. Drying is uniform over a wide width, which is a benefit in heavier or longer forage. The user can also deliver a swath of varying width. The slow rotor speed is also ideal for delicate forages.

The FC 3115 R is equipped with a SQUAREFLEX roller conditioner. The large diameter rollers with the exclusive profile feature a standard double drive synchronized for life. This design ensures an effective conditioning of any forage (alfalfa, rye grass, mesclun...), with a high output while minimizing maintenance time.

The FC 3115 D and FC 3115 R models are fitted with the new OPTIDISC ELITE cutter bar renowned for its robustness and quality of cut in all conditions. Easy to use, this cutter bar requires no maintenance and benefits from the FAST-FIT quick release knife system.

The LIFT-CONTROL suspension offers a powerful and constant suspension for improved plant cover protection. Coupled with a release system, it contributes to the effective protection of the machine from obstacles. The largely offset left-hand swivel point also contributes to effective protection of working parts, especially on the first discs. The reset to the work position is done non-stop.

For farms located in very hilly areas or with medium-sized tractors, an adaptable counterweight on the left side of the chassis is available as optional equipment. This reduces the imbalance in the tractor hitch.

Combined to a front mounted mower, these machines allow reaching a higher work output.
